Policy Meets Production: Introducing the Project X Open Source Community

Stuart Battersby
sbatters@redhat.com

AI Safety & Model Evaluation Architect, Red Hat

Abstract

The AI safety ecosystem has strong and varied foundations such as evaluation frameworks, red-teaming tools, guardrail libraries, and risk ontologies. Yet a critical gap remains. None of these connect to an organization's own, custom AI policies, and none orchestrate the full journey from written policy document to production-deployed safety controls. The result is months of manual work, disconnected audit trails and a process that demands AI safety expertise most organizations simply don't have.

This talk introduces Project X, a new collaborative open source community building the orchestration layer the ecosystem is missing. Project X will connect policy documents to automated risk extraction, scenario-driven safety evaluation, and deployable controls. It will integrate existing tools rather than replacing them. The goal is simple: get organizations from AI governance policy to production without requiring specialist AI safety expertise at every step.

We'll cover the initial technical architecture, the community's collaborative model spanning industry and academia, and how to get involved, whether as a contributor, early adopter, or research collaborator shaping what gets built.
